CIB1 Antibody (monoclonal) (M01) - Background

The protein encoded by this gene is a member of the calcium-binding protein family. The specific function of this protein has not yet been determined; however this protein is known to interact with DNA-dependent protein kinase and may play a role in kinase-phosphatase regulation of DNA end joining. This protein also interacts with integrin α (IIb) β (3), which may implicate this protein as a regulatory molecule for α (IIb) β (3).
