Anti-Digoxigenin antibody - Protein Information**Name** GZMB {ECO:0000303|PubMed:32188940, ECO:0000312|HGNC:HGNC:4709}**Function**

Abundant protease in the cytosolic granules of cytotoxic T- cells and NK-cells which activates caspase-independent pyroptosis when delivered into the target cell through the immunological synapse (PubMed:[3262682](#), PubMed:[3263427](#), PubMed:[1985927](#)). It cleaves after Asp (PubMed:[8258716](#), PubMed:[1985927](#)). Once delivered into the target cell, acts by catalyzing cleavage of gasdermin-E (GSDME), releasing the pore- forming moiety of GSDME, thereby triggering pyroptosis and target cell death

Cellular Location

(PubMed:[32188940](#), PubMed:[31953257](#)).
Seems to be linked to an activation
cascade of caspases (aspartate-specific
cysteine proteases) responsible for
apoptosis execution. Cleaves caspase-3, -7,
-9 and 10 to give rise to active enzymes
mediating apoptosis (PubMed:[9852092](#)).
Secreted. Cytolytic granule.
Note=Delivered into the target cell by
perforin (PubMed:20038786).
