IL5 antibody - middle region - Protein Information**Name** IL5**Synonyms** IL-5**Function**

Homodimeric cytokine expressed predominantly by T-lymphocytes and NK cells that plays an important role in the survival, differentiation, and chemotaxis of eosinophils (PubMed:10444455, PubMed:1873482). Also acts on activated and resting B-cells to induce immunoglobulin production, growth, and differentiation (PubMed:3128631).

Mechanistically, exerts its biological effects through a receptor composed of IL5RA subunit and the cytokine receptor common subunit beta/CSF2RB. Binding to the receptor leads to activation of various kinases including LYN, SYK and JAK2 and thereby propagates signals through the RAS-MAPK and JAK-STAT5 pathways respectively (By similarity).

Cellular Location

Secreted.

Tissue Location

Expressed in lymphoid cells, including spleen, thymus, lymph nodes and peripheral blood mononuclear cells
