Background Descriptions

This gene encodes a member of the nucleosome assembly protein (NAP) family which can interact with both core and linker histones. It can shuttle between the cytoplasm and nucleus, suggesting a role as a histone chaperone. This gene is one of several located near the imprinted gene domain of 11p15.5, an important tumor-suppressor gene region. Alterations in this region have been associated with the Beckwith-Wiedemann syndrome, Wilms tumor, rhabdomyosarcoma, adrenocortical carcinoma, and lung, ovarian, and breast cancer. NAP1L4 Polyclonal Antibody - Protein Information

Name NAP1L4 ([HGNC:7640](#))

Function

Acts as a histone chaperone in nucleosome assembly.

Cellular Location

Nucleus. Cytoplasm. Note=Present in the cytoplasm and excluded from the nucleus during G0/G1 phase, then relocates to the nucleus by the time cells are in S phase (PubMed:9325046). Phosphorylated form localizes in the cytoplasm during the G0/G1 transition, whereas dephosphorylation leads to relocalization into the nucleus at the G1/S- boundary (PubMed:10764593).

Tissue Location

Ubiquitous. Biallelically expressed in fetal and adult tissues. Highest levels in testis.
