Background Descriptions

This gene encodes a member of the NHERF family of PDZ scaffolding proteins. These proteins mediate many cellular processes by binding to and regulating the membrane expression and protein-protein interactions of membrane receptors and transport proteins. The encoded protein plays a role in intestinal sodium absorption by regulating the activity of the sodium/hydrogen exchanger 3, and may also regulate the cystic fibrosis transmembrane regulator (CFTR) ion channel. Alternatively spliced transcript variants encoding multiple isoforms have been observed for this gene. [provided by RefSeq, Nov 2011]

SLC9A3R2 Polyclonal Antibody - Protein Information

Name NHERF2 ([HGNC:11076](#))

Synonyms SLC9A3R2

Function

Scaffold protein that connects plasma membrane proteins with members of the ezrin/moesin/radixin family and thereby helps to link them to the actin cytoskeleton and to regulate their surface expression. Necessary for cAMP-mediated phosphorylation and inhibition of SLC9A3 (PubMed:<http://www.uniprot.org/citations/18829453> target="_blank">18829453). May also act as scaffold protein in the nucleus.

Cellular Location

Endomembrane system; Peripheral membrane protein. Nucleus. Apical cell membrane
Note=Localizes with EZR and PODXL at the apical cell membrane of glomerular epithelium cells and the sides of the food processes (By similarity). Nuclear, in a punctate pattern.

Tissue Location

Widely expressed.
