affinity purified by Protein A

Buffer 0.01M TBS (pH7.4) with 1% BSA, 0.02%

Proclin300 and 50% Glycerol.

SUBCELLULAR LOCATION Nucleus. Chromosome. Note=Associates

with chromatin and mitotic chromosomes.
Contains 1 bromo domain. Contains 1
MYND-type zinc finger. Contains 1
PHD-type zinc finger. Contains 1 PWWP

domain.

SUBUNIT Interacts (via MYND-type zinc finger) with

NCOR1. Interacts (via MYND-type zinc finger) with human adenovirus early E1A protein (via PXLXP motif); this interaction inhibits E1A mediated transactivation. Interacts (via MYND-type zinc finger) with Epstein-Barr virus EBNA2 protein (via PXLXP motif). Interacts (via MYND-type

zinc finger) with EZH2. Interacts with E2F6.
Post-translational modifications
Phosphorylated upon DNA damage,

probably by ATM or ATR. Ubiquitinated, leading to proteasomal degradation. This product as supplied is intended for research use only, not for use in human,

therapeutic or diagnostic applications.

Background Descriptions

Important Note

The protein encoded by this gene was first identified by its ability to bind the adenovirus E1A protein. The protein localizes to the nucleus. It functions as a transcriptional repressor, and expression of E1A inhibits this repression. Alternatively spliced transcript variants encoding different isoforms have been identified. BS69 Polyclonal Antibody - Protein Information

Name ZMYND11 (HGNC:16966)

Function

Chromatin reader that specifically recognizes and binds histone H3.3 trimethylated at 'Lys-36' (H3.3K36me3) and regulates RNA polymerase II elongation. Does not bind other histone H3 subtypes (H3.1 or H3.2) (By similarity). Colocalizes with highly expressed genes and functions as a transcription corepressor by modulating RNA polymerase II at the elongation stage. Binds non-specifically to dsDNA (PubMed:24675531). Acts as a tumor-suppressor by repressing a transcriptional program essential for tumor cell growth.

Cellular Location

Nucleus. Chromosome Note=Associates with chromatin and mitotic chromosomes
