Glycogen synthase participates in the glycogen biosynthetic process along with glycogenin and glycogen branching enzyme. Extends the primer composed of a few glucose units formed by glycogenin by adding new glucose units to it. In this context, glycogen synthase transfers the glycosyl residue from UDP-Glc to the non-reducing end of alpha-1,4-glucan.**Tissue Location**
Expressed in skeletal muscle and most other cell types where glycogen is present.**Glycogen Synthase 1 Rabbit mAb - Protocols**
