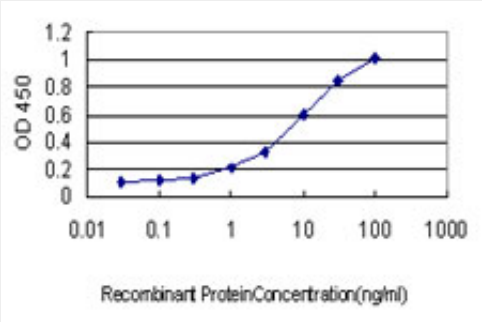
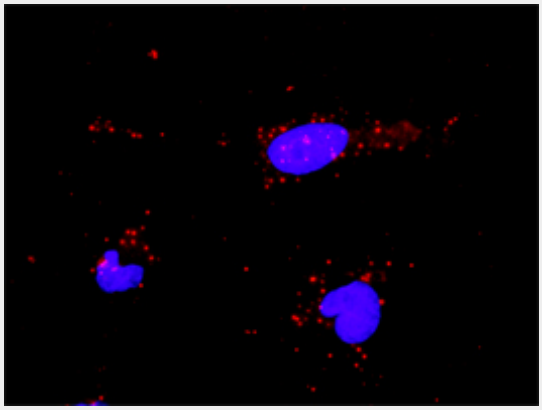
PML monoclonal antibody (M02), clone 1D12 Western Blot analysis of PML expression in Hela S3 NE ((Cat # AT3354a)



Detection limit for recombinant GST tagged PML is approximately 0.3ng/ml as a capture antibody.



Proximity Ligation Analysis of protein-protein interactions between TP53 and PML HeLa cells were stained with anti-TP53 rabbit purified polyclonal 1:1200 and anti-PML mouse monoclonal antibody 1:50. Each red dot represents the detection of protein-protein interaction complex, and nuclei were counterstained with DAPI (blue).

PML Antibody (monoclonal) (M02) - Background

The protein encoded by this gene is a member of the tripartite motif (TRIM) family. The TRIM motif includes three zinc-binding domains, a RING, a B-box type 1 and a B-box type 2, and a coiled-coil region. This phosphoprotein localizes to nuclear bodies where it functions as a transcription factor and tumor suppressor. Its expression is cell-cycle related and it regulates the p53 response to oncogenic signals. The gene is often involved in the translocation with the retinoic acid receptor

alpha gene associated with acute promyelocytic leukemia (APL). Extensive alternative splicing of this gene results in several variations of the protein's central and C-terminal regions; all variants encode the same N-terminus. Alternatively spliced transcript variants encoding different isoforms have been identified.
