

RBP3 Antibody (monoclonal) (M01)

Mouse monoclonal antibody raised against a partial recombinant RBP3. Catalog # AT3600a

Specification

RBP3 Antibody (monoclonal) (M01) - Product Information

Application WB, E **Primary Accession** P10745 Other Accession NM 002900 Reactivity Human Host mouse Clonality **Monoclonal** Isotype IgG2a Kappa Calculated MW 135363

RBP3 Antibody (monoclonal) (M01) - Additional Information

Gene ID 5949

Other Names

Retinol-binding protein 3, Interphotoreceptor retinoid-binding protein, IRBP, Interstitial retinol-binding protein, RBP3

Target/Specificity

RBP3 (NP_002891, 1149 a.a. \sim 1246 a.a) partial recombinant protein with GST tag. MW of the GST tag alone is 26 KDa.

Dilution

WB~~1:500~1000

Format

Clear, colorless solution in phosphate buffered saline, pH 7.2.

Storage

Store at -20°C or lower. Aliquot to avoid repeated freezing and thawing.

Precautions

RBP3 Antibody (monoclonal) (M01) is for research use only and not for use in diagnostic or therapeutic procedures.

RBP3 Antibody (monoclonal) (M01) - Protocols

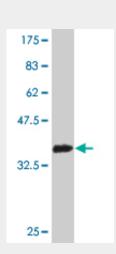

Provided below are standard protocols that you may find useful for product applications.

- Western Blot
- Blocking Peptides
- Dot Blot

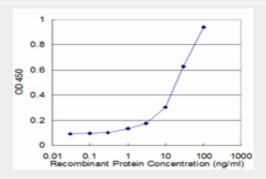

- Immunohistochemistry
- Immunofluorescence
- <u>Immunoprecipitation</u>
- Flow Cytomety
- Cell Culture

RBP3 Antibody (monoclonal) (M01) - Images

Antibody Reactive Against Recombinant Protein. Western Blot detection against Immunogen (36.52 KDa).

Detection limit for recombinant GST tagged RBP3 is approximately 1ng/ml as a capture antibody.

RBP3 Antibody (monoclonal) (M01) - Background

Interphotoreceptor retinol-binding protein is a large glycoprotein known to bind retinoids and found primarily in the interphotoreceptor matrix of the retina between the retinal pigment epithelium and the photoreceptor cells. It is thought to transport retinoids between the retinal pigment epithelium and the photoreceptors, a critical role in the visual process. The human IRBP gene is approximately 9.5 kbp in length and consists of four exons separated by three introns. The introns are 1.6-1.9 kbp long. The gene is transcribed by photoreceptor and retinoblastoma cells into an approximately 4.3-kilobase mRNA that is translated and processed into a glycosylated protein of 135,000 Da. The amino acid sequence of human IRBP can be divided into four contiguous homology domains with 33-38% identity, suggesting a series of gene duplication events. In the gene, the boundaries of these domains are not defined by exon-intron junctions, as might have been expected. The first three homology domains and part of the fourth are all encoded by the first large exon, which is 3,180 base pairs long. The remainder of the fourth domain is encoded in the last three exons, which are 191, 143, and approximately 740 base pairs long, respectively.

RBP3 Antibody (monoclonal) (M01) - References
