

CRFR1 Antibody (Q103) Blocking peptide
Synthetic peptide
Catalog # BP11441a**Specification**

CRFR1 Antibody (Q103) Blocking peptide - Product InformationPrimary Accession [P34998](#)**CRFR1 Antibody (Q103) Blocking peptide - Additional Information****Gene ID** 1394**Other Names**

Corticotropin-releasing factor receptor 1, CRF-R-1, CRF-R1, CRFR-1, Corticotropin-releasing hormone receptor 1, CRH-R-1, CRH-R1, CRHR1, CRFR, CRFR1, CRHR

Format

Peptides are lyophilized in a solid powder format. Peptides can be reconstituted in solution using the appropriate buffer as needed.

Storage

Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C.

Precautions

This product is for research use only. Not for use in diagnostic or therapeutic procedures.

CRFR1 Antibody (Q103) Blocking peptide - Protein Information**Name** CRHR1 ([HGNC:2357](#))**Function**

G-protein coupled receptor for CRH (corticotropin-releasing factor) and UCN (urocortin). Has high affinity for CRH and UCN. Ligand binding causes a conformation change that triggers signaling via guanine nucleotide-binding proteins (G proteins) and down-stream effectors, such as adenylate cyclase. Promotes the activation of adenylate cyclase, leading to increased intracellular cAMP levels. Inhibits the activity of the calcium channel CACNA1H. Required for normal embryonic development of the adrenal gland and for normal hormonal responses to stress. Plays a role in the response to anxiogenic stimuli.

Cellular Location

Cell membrane; Multi-pass membrane protein. Endosome. Note=Agonist-binding promotes endocytosis

Tissue Location

Predominantly expressed in the cerebellum, pituitary, cerebral cortex and olfactory lobe

CRFR1 Antibody (Q103) Blocking peptide - Protocols

Provided below are standard protocols that you may find useful for product applications.

CRFR1 Antibody (Q103) Blocking peptide - Background

This gene encodes a G-protein coupled receptor that binds neuropeptides of the corticotropin releasing hormone family that are major regulators of the hypothalamic-pituitary-adrenal pathway. The encoded protein is essential for the activation of signal transduction pathways that regulate diverse physiological processes including stress, reproduction, immune response and obesity. Alternative splicing results in multiple transcript variants.
