

PSMD1 Antibody (N-term) Blocking Peptide

Synthetic peptide Catalog # BP14601a

Specification

PSMD1 Antibody (N-term) Blocking Peptide - Product Information

Primary Accession

Q99460

PSMD1 Antibody (N-term) Blocking Peptide - Additional Information

Gene ID 5707

Other Names

26S proteasome non-ATPase regulatory subunit 1, 26S proteasome regulatory subunit RPN2, 26S proteasome regulatory subunit S1, 26S proteasome subunit p112, PSMD1

Format

Peptides are lyophilized in a solid powder format. Peptides can be reconstituted in solution using the appropriate buffer as needed.

Storage

Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C.

Precautions

This product is for research use only. Not for use in diagnostic or therapeutic procedures.

PSMD1 Antibody (N-term) Blocking Peptide - Protein Information

Name PSMD1

Function

Component of the 26S proteasome, a multiprotein complex involved in the ATP-dependent degradation of ubiquitinated proteins. This complex plays a key role in the maintenance of protein homeostasis by removing misfolded or damaged proteins, which could impair cellular functions, and by removing proteins whose functions are no longer required. Therefore, the proteasome participates in numerous cellular processes, including cell cycle progression, apoptosis, or DNA damage repair.

PSMD1 Antibody (N-term) Blocking Peptide - Protocols

Provided below are standard protocols that you may find useful for product applications.

The 26S proteasome is a multicatalytic proteinase complexwith a highly ordered structure composed of 2 complexes, a 20S coreand a 19S regulator. The 20S core is composed of 4 rings of 28non-identical subunits; 2 rings are composed of 7 alpha subunitsand 2 rings are composed of 7 beta subunits. The 19S regulator iscomposed of a base, which contains 6 ATPase subunits and 2non-ATPase subunits, and a lid, which contains up to 10 non-ATPasesubunits. Proteasomes are distributed throughout eukaryotic cellsat a high concentration and cleave peptides in anATP/ubiquitin-dependent process in a non-lysosomal pathway. Anessential function of a modified proteasome, the immunoproteasome, is the processing of class I MHC peptides. This gene encodes thelargest non-ATPase subunit of the 19S regulator lid, which is responsible for substrate recognition and binding. Alternatively spliced transcript variants have been found for this gene. [providedby RefSeq].
