

Catalog # BP1723b

BIKE Antibody (N-term) Blocking Peptide Synthetic peptide

Specification

BIKE Antibody (N-term) Blocking Peptide - Product Information

Primary Accession

<u>Q9NSY1</u>

BIKE Antibody (N-term) Blocking Peptide - Additional Information

Gene ID 55589

Other Names BMP-2-inducible protein kinase, BIKe, BMP2K, BIKE

Target/Specificity

The synthetic peptide sequence used to generate the antibody AP1723b was selected from the N-term region of human BIKE . A 10 to 100 fold molar excess to antibody is recommended. Precise conditions should be optimized for a particular assay.

Format

Peptides are lyophilized in a solid powder format. Peptides can be reconstituted in solution using the appropriate buffer as needed.

Storage Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C.

Precautions This product is for research use only. Not for use in diagnostic or therapeutic procedures.

BIKE Antibody (N-term) Blocking Peptide - Protein Information

Name BMP2K

Synonyms BIKE

Function May be involved in osteoblast differentiation.

Cellular Location Nucleus.

BIKE Antibody (N-term) Blocking Peptide - Protocols

Provided below are standard protocols that you may find useful for product applications.

BIKE Antibody (N-term) Blocking Peptide - Background

BIKE is the human homolog of mouse BMP-2-inducible kinase. Bone morphogenic proteins (BMPs) play a key role in skeletal development and patterning. Expression of the mouse gene is increased during BMP-2 induced differentiation and the gene product is a putative serine/threonine protein kinase containing a nuclear localization signal. Therefore, the protein encoded by this human homolog is thought to be a protein kinase with a putative regulatory role in attenuating the program of osteoblast differentiation.
