

GNRHR Antibody (N-term) Blocking Peptide

Synthetic peptide Catalog # BP18314a

Specification

GNRHR Antibody (N-term) Blocking Peptide - Product Information

Primary Accession

P30968

GNRHR Antibody (N-term) Blocking Peptide - Additional Information

Gene ID 2798

Other Names

Gonadotropin-releasing hormone receptor, GnRH receptor, GnRH-R, GNRHR, GRHR

Format

Peptides are lyophilized in a solid powder format. Peptides can be reconstituted in solution using the appropriate buffer as needed.

Storage

Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C.

Precautions

This product is for research use only. Not for use in diagnostic or therapeutic procedures.

GNRHR Antibody (N-term) Blocking Peptide - Protein Information

Name GNRHR

Synonyms GRHR

Function

Receptor for gonadotropin releasing hormone (GnRH) that mediates the action of GnRH to stimulate the secretion of the gonadotropic hormones luteinizing hormone (LH) and follicle-stimulating hormone (FSH). This receptor mediates its action by association with G-proteins that activate a phosphatidylinositol-calcium second messenger system. Isoform 2 may act as an inhibitor of GnRH-R signaling.

Cellular Location

Cell membrane; Multi-pass membrane protein.

Tissue Location

Pituitary, ovary, testis, breast and prostate but not in liver and spleen

GNRHR Antibody (N-term) Blocking Peptide - Protocols

Provided below are standard protocols that you may find useful for product applications.

GNRHR Antibody (N-term) Blocking Peptide - Background

This gene encodes the receptor for type 1gonadotropin-releasing hormone. This receptor is a member of theseven-transmembrane, G-protein coupled receptor (GPCR) family. Itis expressed on the surface of pituitary gonadotrope cells as wellas lymphocytes, breast, ovary, and prostate. Following binding ofgonadotropin-releasing hormone, the receptor associates withG-proteins that activate a phosphatidylinositol-calcium secondmessenger system. Activation of the receptor ultimately causes therelease of gonadotropic luteinizing hormone (LH) and folliclestimulating hormone (FSH). Defects in this gene are a cause ofhypogonadotropic hypogonadism (HH). Alternative splicing results inmultiple transcript variants encoding different isoforms. More than18 transcription initiation sites in the 5' region and multiplepolyA signals in the 3' region have been identified for this gene.
