

ACER1 Antibody (C-term) Blocking Peptide
Synthetic peptide
Catalog # BP18654b**Specification**

ACER1 Antibody (C-term) Blocking Peptide - Product InformationPrimary Accession [Q8TDN7](#)**ACER1 Antibody (C-term) Blocking Peptide - Additional Information****Gene ID** 125981**Other Names**

Alkaline ceramidase 1, AlkCDase 1, Alkaline CDase 1, Acylsphingosine deacylase 3, N-acylsphingosine amidohydrolase 3, ACER1, ASAH3

Format

Peptides are lyophilized in a solid powder format. Peptides can be reconstituted in solution using the appropriate buffer as needed.

Storage

Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C.

Precautions

This product is for research use only. Not for use in diagnostic or therapeutic procedures.

ACER1 Antibody (C-term) Blocking Peptide - Protein Information**Name** ACER1 ([HGNC:18356](#))**Synonyms** ASAH3**Function**

Endoplasmic reticulum ceramidase that catalyzes the hydrolysis of ceramides into sphingosine and free fatty acids at alkaline pH (PubMed: [17713573](http://www.uniprot.org/citations/17713573), PubMed: [20207939](http://www.uniprot.org/citations/20207939), PubMed: [20628055](http://www.uniprot.org/citations/20628055)). Ceramides, sphingosine, and its phosphorylated form sphingosine-1-phosphate are bioactive lipids that mediate cellular signaling pathways regulating several biological processes including cell proliferation, apoptosis and differentiation (PubMed: [12783875](http://www.uniprot.org/citations/12783875)). Exhibits a strong substrate specificity towards the natural stereoisomer of ceramides with D-erythro-sphingosine as a backbone and has a higher activity towards very long-chain unsaturated fatty acids like the C24:1-ceramide (PubMed: [17713573](http://www.uniprot.org/citations/17713573), PubMed: [20207939](http://www.uniprot.org/citations/20207939)). May also hydrolyze dihydroceramides to produce dihydrosphingosine (PubMed: [20207939](http://www.uniprot.org/citations/20207939), PubMed: [20207939](http://www.uniprot.org/citations/20207939)).

[20628055](http://www.uniprot.org/citations/20628055)). ACER1 is a skin-specific ceramidase that regulates the levels of ceramides, sphingosine and sphingosine-1-phosphate in the epidermis, mediates the calcium-induced differentiation of epidermal keratinocytes and more generally plays an important role in skin homeostasis (PubMed: [17713573](http://www.uniprot.org/citations/17713573)).

Cellular Location

Endoplasmic reticulum membrane; Multi-pass membrane protein

Tissue Location

Mainly expressed in epidermis.

ACER1 Antibody (C-term) Blocking Peptide - Protocols

Provided below are standard protocols that you may find useful for product applications.

ACER1 Antibody (C-term) Blocking Peptide - Images**ACER1 Antibody (C-term) Blocking Peptide - Background**

Ceramides are synthesized during epidermal differentiation and accumulate within the interstices of the stratum corneum, where they represent critical components of the epidermal permeability barrier. Excess cellular ceramide can trigger antimitogenic signals and induce apoptosis, and the ceramide metabolites sphingosine and sphingosine-1-phosphate (S1P) are important bioregulatory molecules. Ceramide hydrolysis in the nucleated cell layers regulates keratinocyte proliferation and apoptosis in response to external stress. Ceramide hydrolysis also occurs at the stratum corneum, releasing free sphingoid base that functions as an endogenous antimicrobial agent. ACER1 is highly expressed in epidermis and catalyzes the hydrolysis of very long chain ceramides to generate sphingosine (Houben et al., 2006 [PubMed 16477081]; Sun et al., 2008 [PubMed 17713573]).
