

# HIST2H3A Antibody(C-term) Blocking peptide Synthetic peptide

Catalog # BP19659b

### Specification

# HIST2H3A Antibody(C-term) Blocking peptide - Product Information

Primary Accession

#### <u>Q71DI3</u>

# HIST2H3A Antibody(C-term) Blocking peptide - Additional Information

Gene ID 126961;333932;653604

Other Names Histone H32, Histone H3/m, Histone H3/o, HIST2H3A

Format

Peptides are lyophilized in a solid powder format. Peptides can be reconstituted in solution using the appropriate buffer as needed.

**Storage** Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C.

**Precautions** This product is for research use only. Not for use in diagnostic or therapeutic procedures.

# HIST2H3A Antibody(C-term) Blocking peptide - Protein Information

Name H3C15 (<u>HGNC:20505</u>)

Function

Core component of nucleosome. Nucleosomes wrap and compact DNA into chromatin, limiting DNA accessibility to the cellular machineries which require DNA as a template. Histones thereby play a central role in transcription regulation, DNA repair, DNA replication and chromosomal stability. DNA accessibility is regulated via a complex set of post-translational modifications of histones, also called histone code, and nucleosome remodeling.

**Cellular Location** Nucleus. Chromosome.

# HIST2H3A Antibody(C-term) Blocking peptide - Protocols

Provided below are standard protocols that you may find useful for product applications.

# HIST2H3A Antibody(C-term) Blocking peptide - Background

Histones are basic nuclear proteins that are responsiblefor the nucleosome structure of the chromosomal fiber ineukaryotes. This structure consists of approximately 146 bp of DNAwrapped around a nucleosome, an octamer composed of pairs of eachof the four core histones (H2A, H2B, H3, and H4). The chromatinfiber is further compacted through the interaction of a linkerhistone, H1, with the DNA between the nucleosomes to form higherorder chromatin structures. This gene is intronless and encodes amember of the histone H3 family. Transcripts from this gene lackpolyA tails; instead, they contain a palindromic terminationelement. This gene is found in a histone cluster on chromosome 1.This gene is one of four histone genes in the cluster that areduplicated; this record represents the telomeric copy. [provided byRefSeq].
