

Recombinant Human Follistatin
Catalog # PBG10116**Specification**

Recombinant Human Follistatin - Product Information**Recombinant Human Follistatin - Additional Information****Description**

Follistatin is a secreted protein that binds to ligands of the TGF- β family and regulates their activity by inhibiting their access to signaling receptors. It was originally discovered as activin antagonists whose activity suppresses expression and secretion of the pituitary hormone FSH (follicle stimulating hormone). In addition to being a natural antagonist, follistatin can inhibit the activity of other TGF- β ligands including BMP-2,-4,-6,-7, Myostatin, GDF-11, and TGF- β 1. Follistatin is expressed in the pituitary, ovaries, decidual cells of the endometrium, and in some other tissues. Recombinant human Follistatin is a 31.5 kDa protein containing 288 amino acids. Its primary structure contains three cysteine-rich domains (called FS domains), each followed by a protease-inhibitory kazal domain.

Biological Activity

Determined by its ability to neutralize Activin A inhibitory effect of murine MPC-11 cells. The expected ED_{50} is 0.1-0.4 μ g/ml in the presence of 7.5 ng/ml Activin A.

Authenticity

Verified by N-terminal and Mass Spectrometry analyses (when applicable).

Endotoxin

Endotoxin level is <0.1 ng/ μ g of protein (<1 EU/ μ g).

Protein Content

Verified by UV Spectroscopy and/or SDS-PAGE gel.

Storage

-20°C

Precautions

Recombinant Human Follistatin is for research use only and not for use in diagnostic or therapeutic procedures.

Recombinant Human Follistatin - Protocols

Provided below are standard protocols that you may find useful for product applications.

- [Western Blot](#)
- [Blocking Peptides](#)
- [Dot Blot](#)
- [Immunohistochemistry](#)

- [Immunofluorescence](#)
- [Immunoprecipitation](#)
- [Flow Cytometry](#)
- [Cell Culture](#)
