

Human CellExp EPOR/Erythropoietin Receptor, human recombinant protein

EPOR, Erythropoietin Receptor.

Catalog # PBV11075r

Specification

Human CellExp EPOR/Erythropoietin Receptor, human recombinant protein - Product info

Primary Accession P19235

Calculated MW This protein is fused with Fc fragment of

human IgG1 at the C-terminus, has a calculated MW of 50.1 kDa. The predicted N-terminus is Ala 25. DTT-reduced Protein

migrates as 55-60 kDa due to

glycosylation. KDa

Human CellExp EPOR/Erythropoietin Receptor, human recombinant protein - Additional Info

Gene ID 2057 Gene Symbol EPOR

Other Names

EPOR, Erythropoietin Receptor.

Gene Source
Source
Assay&Purity
Assay&Purity
SDS-PAGE; ≥92%

Assay2&Purity2 N/A; Recombinant Yes

Results Measured by its ability to inhibit

Epo-dependent proliferation of TF-1 human erythroleukemic cells. The ED50 for this effect is typically 2 - 6 ng/ml in the presence of 0.2 U/ml of rhEpo-Fc.

Target/Specificity

EPOR/Erythropoietin Receptor

Application Notes

Centrifuge the vial prior to opening. Reconstitute in sterile PBS, pH 7.4 to a concentration of 50 μ g/ml. Do not vortex. This solution can be stored at 2-8°C for up to 1 month. For extended storage, it is recommended to store at -20°C.

Format

Lyophilized

Storage

-20°C; Lyophilized from 0.22 μ m filtered solution in 50 mM tris, 100 mM glycine, pH 7.0. Normally Mannitol or Trehalose is added as protectants before lyophilization.

Human CellExp EPOR/Erythropoietin Receptor, human recombinant protein - Protocols

Provided below are standard protocols that you may find useful for product applications.

- Western Blot
- Blocking Peptides
- Dot Blot
- Immunohistochemistry
- Immunofluorescence
- Immunoprecipitation
- Flow Cytomety
- Cell Culture

Human CellExp EPOR/Erythropoietin Receptor, human recombinant protein - Background

Erythropoietin (EPO) is the major glycoprotein hormone regulator of mammalian erythropoiesis, and is produced by kidney and liver in an oxygen-dependent manner. The biological effects of EPO are mediated by the specific erythropoietin receptor (EPOR) on bone marrow erythroblasts, which transmits signals important for both proliferation and differentiation along the erythroid lineage. EPOR is a type 1 single-transmembrane cytokine receptor, and belongs to the homodimerizing subclass which functions as ligand-induced or ligand-stabilized homodimers. EPOR pre-exists as dimers which upon binding of a 34 kDa ligand erythropoietin (EPO), changes its homodimerized state. These conformational changes result in the autophosphorylation of Jak2 kinases that are pre-associated with the receptor. Erythropoietin is necessary to maintain endothelial cells and to promote tumor angiogenesis, hence the dysregulation of EpoR may affect the growth of certain tumors. EpoR signaling prevents neuronal death and ischemic injury.
