

Pro-MMP-2, mouse recombinant protein

Matrix metalloproteinase-2, MMP, MMP recombinant, MMP protein, MMP inhibitor Catalog # PBV11349r

Specification

Pro-MMP-2, mouse recombinant protein - Product info

Primary Accession Q3UG07

Concentration 0.05 mg/ ml; >40 mU/mg (Masui

substrate), >40 mU/mg (Knight substrate)

- APMA activation, 1 hour/37oC

Calculated MW 40/42 kDa KDa

Pro-MMP-2, mouse recombinant protein - Additional Info

Gene ID 17390
Gene Symbol MMP2

Other Names

72 kDa type IV collagenase (EC 3.4.24.24) (72 kDa gelatinase) (Gelatinase A) (Matrix metalloproteinase-2) (MMP-2) [Cleaved into: PEX]

Gene Source Human

Source mouse fibroblasts
Assay&Purity SDS-PAGE; ≥90%
Assay2&Purity2 HPLC;

Recombinant Format Liquid

Storage

-80°C; In 50 mM Tris-HCl, pH 7; 200 mM NaCl; 5 mM CaCl₂; 1 μM ZnCl₂; 0.05% Brij 35; 0,05% NaN₃

No

Pro-MMP-2, mouse recombinant protein - Protocols

Provided below are standard protocols that you may find useful for product applications.

- Western Blot
- Blocking Peptides
- Dot Blot
- Immunohistochemistry
- Immunofluorescence
- Immunoprecipitation
- Flow Cytomety
- Cell Culture

Pro-MMP-2, mouse recombinant protein - Images

Pro-MMP-2, mouse recombinant protein - Background

The progelatinase A, a member of the matrix metalloproteinase (MMP) family, has been isolated

from macrophages and fibroblasts. Gelatinase A hydrolyses several components of the extracellular matrix, e.g. the collagen types IV, V and XI and gelatin. Progelatinase A complexed via their C-terminal domain with TIMP-2 was isolated from culture media of different cell types. This complex shows both properties of its constituents: Like TIMP-2 it inhibits active matrix metalloproteinases and like gelatinase it shows proteolytic activity after activation with APMA (4-aminophenylmercury acetate). However, its proteolytic activity is less than 10% of that of gelatinase A not complexed with TIMP-2. In contrast to the other MMPs the progelatinase A cannot be activated by the serine proteinase trypsin. Until quite recently a potential natural activator that can transform latent progelatinase A into the active form was unknown. It was shown that the catalytic domain of the membrane type 2-matrix metalloproteinase activates progelatinase A as well as the progelatinase A / TIMP-2 complex, by cleaving the 72 kDa progelatinase A to yield 67 kDa gelatinase A, which is than transformed into 62 kDa gelatinase A. The 62 kDa form is about twice as active as the 67 kDa form towards the Dnp-pepitde (Masui et al.). No significant difference in activity was found between free and complexed gelatinase A forms.
